

**Intermediate Microeconomics (Fall 2023)**  
**Lecture 3**  
**Preference, Utility and Indifference Curve**

**Part I****Margin and Rational Behavior**

- **Marginal Benefit (MB)** – An increase (or decrease) in \_\_\_\_\_ that is caused by a \_\_\_\_\_ in the level of that activity, all other factors remaining constant.
- **Marginal Cost (MC)** – An increase (or decrease) in \_\_\_\_\_ that is caused by a \_\_\_\_\_ in the level of that activity, all other factors remaining constant.
- **Rational Behavior**

For each additional unit

- If MB \_\_\_\_\_ MC,  
Go for it! (Consume this extra unit)
- If MB \_\_\_\_\_ MC,  
Avoid it! (Do not consume this extra unit)
- Thus, keep consuming until MB \_\_\_\_\_ MC.
  - Optimal behavior for a rational person: MB \_\_\_\_\_ MC.

**Part II**

**Preference** – \_\_\_\_\_.

❖ Bundle of goods: \_\_\_\_\_ and \_\_\_\_\_.

❖ Notation:

➤ \_\_\_\_\_: \_\_\_\_\_.

➤ \_\_\_\_\_: \_\_\_\_\_.

– the consumer is \_\_\_\_\_ between the two bundles of goods,  
i.e., the consumer would be just \_\_\_\_\_.

⇒ ■ \_\_\_\_\_: the consumer

– the consumer \_\_\_\_\_.

■ \_\_\_\_\_: the consumer

– the consumer \_\_\_\_\_.

or is \_\_\_\_\_.

⇒ If \_\_\_\_\_ and \_\_\_\_\_, then \_\_\_\_\_.

• **Basic Properties of Preference Ordering**

① \_\_\_\_\_ – For any 2 bundles A and B, either  
\_\_\_\_\_, or \_\_\_\_\_, or \_\_\_\_\_, i.e., either  
\_\_\_\_\_, or \_\_\_\_\_, or \_\_\_\_\_.

② \_\_\_\_\_ – \_\_\_\_\_:  
\_\_\_\_\_.

③ \_\_\_\_\_ – “\_\_\_\_\_”:  
if \_\_\_\_\_,  
\_\_\_\_\_, then \_\_\_\_\_.

④ \_\_\_\_\_ – \_\_\_\_\_.

■ For any 3 bundles, if \_\_\_\_\_ and \_\_\_\_\_, then \_\_\_\_\_.

■ For any 3 bundles, if \_\_\_\_\_ and \_\_\_\_\_, then \_\_\_\_\_.

## Part III

**Utility** – A \_\_\_\_\_ representing the  
\_\_\_\_\_ that a \_\_\_\_\_  
\_\_\_\_\_, which is to describe \_\_\_\_\_.

*Example 1: Like an orange better than an apple*

- **Utility Function** – A \_\_\_\_\_ of \_\_\_\_\_ a \_\_\_\_\_ of \_\_\_\_\_ to \_\_\_\_\_ such that \_\_\_\_\_

### Example 2

Utility function for food (F) and clothing (C) is given by  $u(F, C) = F + 2C$ .

- ① Bundle A with 8 units of food and 3 units of clothing generates a utility level of
- ② Bundle B with 6 units of food and 4 units of clothing generates a utility level of
- ③ Bundle C with 4 units of food and 4 units of clothing generates a utility level of

- **Ordinal Utility** – A theory of \_\_\_\_\_ that emphasizes on \_\_\_\_\_ bundles of goods: the \_\_\_\_\_ of the \_\_\_\_\_ is only important insofar as it \_\_\_\_\_ the \_\_\_\_\_; the \_\_\_\_\_ of the \_\_\_\_\_.

- **Monotonic Transformation** – A way of \_\_\_\_\_ in a way that \_\_\_\_\_ the \_\_\_\_\_ of the \_\_\_\_\_, represented by a \_\_\_\_\_ that \_\_\_\_\_ in the sense that \_\_\_\_\_.

❖ The rate of change in  $f(u)$  as  $u$  changes can be measured by:

- ⇒ For a monotonic transformation, \_\_\_\_\_ always has the \_\_\_\_\_ as \_\_\_\_\_.
- ⇒ A monotonic function always has a \_\_\_\_\_ of \_\_\_\_\_.
- ⇒ The graph of a monotonic function will always have a \_\_\_\_\_.

*Example 3: A positive monotonic transformation*

- ① Panel A illustrates a \_\_\_\_\_  
– one that is always \_\_\_\_\_.
- ② Panel B illustrates a function that is \_\_\_\_\_,  
since it sometimes \_\_\_\_\_ and sometimes \_\_\_\_\_.

- **Cardinal Utility** – A theory of \_\_\_\_\_ that attach a  
\_\_\_\_\_ to the \_\_\_\_\_  
of \_\_\_\_\_, i.e., the \_\_\_\_\_ of the  
\_\_\_\_\_ between two bundles  
of goods is supposed to have some sort of \_\_\_\_\_.

- **Marginal Utility (MU)** – \_\_\_\_\_ obtained from \_\_\_\_\_ of a good.

MU = \_\_\_\_\_

= \_\_\_\_\_

- **Law of Diminishing MU** – As \_\_\_\_\_ of a \_\_\_\_\_ is \_\_\_\_\_, the \_\_\_\_\_ of \_\_\_\_\_ will \_\_\_\_\_ to \_\_\_\_\_.

- **Marginal Rate of Substitution (MRS)** – \_\_\_\_\_ a \_\_\_\_\_ to \_\_\_\_\_ of the \_\_\_\_\_.  
Mathematically defined as a \_\_\_\_\_ whose \_\_\_\_\_ is the \_\_\_\_\_ at which \_\_\_\_\_.

Suppose we have Goods X and Y.

**Part IV**

**Indifference Curve (IC)** – A curve showing \_\_\_\_\_  
 \_\_\_\_\_ of \_\_\_\_\_ that \_\_\_\_\_ the  
 \_\_\_\_\_ of \_\_\_\_\_.

- **Draw the IC**

- Given a utility function,  $u(x_1, x_2)$ , plot all the points  $(x_1, x_2)$  such that  $u(x_1, x_2)$  equals a \_\_\_\_\_.
- For each \_\_\_\_\_ of the \_\_\_\_\_, there is a \_\_\_\_\_.

- The Slope of the IC – The \_\_\_\_\_.

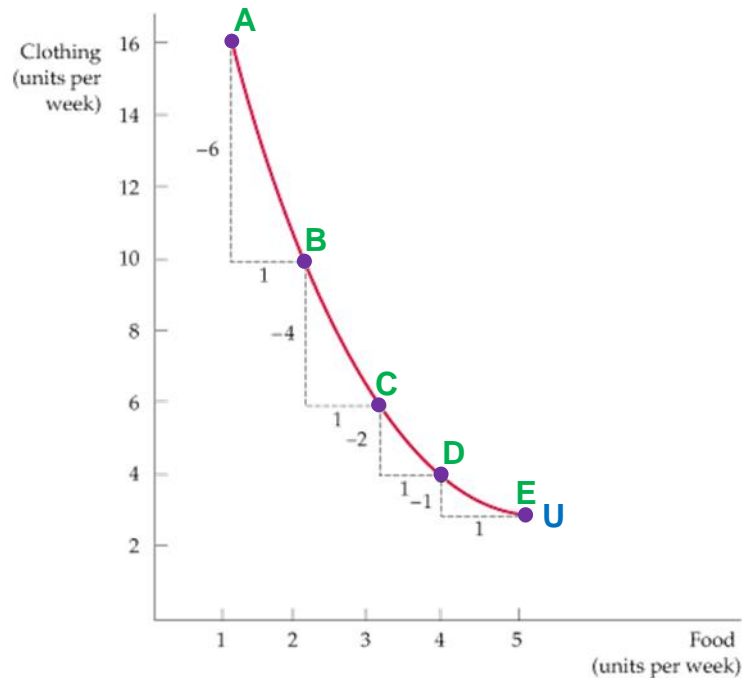

- Monotonicity implies that the ICs have a \_\_\_\_\_ slope.
- Think of the IC as being described by a function \_\_\_\_\_, such that

⇒ If \_\_\_\_\_ of \_\_\_\_\_,  
 \_\_\_\_\_, is \_\_\_\_\_ the  
 \_\_\_\_\_, could \_\_\_\_\_,  
 an \_\_\_\_\_ that is \_\_\_\_\_ to  
 \_\_\_\_\_,  
 so that he is \_\_\_\_\_  
 \_\_\_\_\_  
 \_\_\_\_\_.

- **The Shape of the IC** – \_\_\_\_\_ (\_\_\_\_\_).

*Example 4: Clothing and food per week*

Law of diminishing MU

⇒ \_\_\_\_\_: As we move along an IC  
 A → B → C, \_\_\_\_\_. Because as \_\_\_\_\_ of one good  
 is consumed, consumers would prefer to \_\_\_\_\_  
 of a \_\_\_\_\_ to \_\_\_\_\_  
 of the \_\_\_\_\_.

⇒ \_\_\_\_\_ the \_\_\_\_\_ of the \_\_\_\_\_.

- **Law of Diminishing MRS** – The \_\_\_\_\_ of  
 \_\_\_\_\_ that a person is willing to \_\_\_\_\_  
 for an \_\_\_\_\_ of  
 \_\_\_\_\_ as the \_\_\_\_\_  
 of \_\_\_\_\_.

- **Implications of Convexity** – \_\_\_\_\_ are  
\_\_\_\_\_ to \_\_\_\_\_.

If \_\_\_\_\_, then

- \_\_\_\_\_
- \_\_\_\_\_

for \_\_\_\_\_ such that \_\_\_\_\_.

*Exercise 1*

Refer to the figure.

The figure shows the indifference curve for car consumers A and B. Compared with Consumer B, Consumer A

- A. cares more about acceleration than space.
- B. cares more about space than acceleration.
- C. is indifferent between acceleration and space.
- D. prefers more expensive rather than less expensive cars.
- E. None of the above.

- **Indifference Map** – A graph \_\_\_\_\_  
that \_\_\_\_\_ a person's \_\_\_\_\_.

- ICs \_\_\_\_\_!
- ⇒ \_\_\_\_\_ of \_\_\_\_\_
- \_\_\_\_\_ and \_\_\_\_\_.

**Part V****Examples of Preferences**

- **Cobb-Douglas Preferences**
  - **Utility Function of the Cobb-Douglas Preferences**

where \_\_\_\_\_ and \_\_\_\_\_ are \_\_\_\_\_ that  
 \_\_\_\_\_ the \_\_\_\_\_ of the consumer.

*Example 5: Cobb-Douglas ICs*

- 1) Panel A shows the case where  $c = \frac{1}{2}$  and  $d = \frac{1}{2}$
- 2) Panel B shows the case where  $c = \frac{1}{5}$  and  $d = \frac{4}{5}$

- **Monotonic Transformation of the Cobb-Douglas Utility Function**

Define \_\_\_\_\_

⇒ \_\_\_\_\_

⇒ Always take a monotonic transformation of the Cobb-Douglas utility function that make the \_\_\_\_\_ to \_\_\_\_\_

- **MRS for the Cobb-Douglas Utility Function**

❖ **The Exponent Representation:** \_\_\_\_\_

❖ **The Log Representation:** \_\_\_\_\_

⇒ The \_\_\_\_\_ as the \_\_\_\_\_.

⇒ A monotonic transformation would \_\_\_\_\_ the \_\_\_\_\_.

➤ It is customary to have \_\_\_\_\_ and \_\_\_\_\_  
\_\_\_\_\_ and \_\_\_\_\_.

- **Perfect Substitutes** – The consumer is willing to \_\_\_\_\_  
\_\_\_\_\_ for the \_\_\_\_\_ at a \_\_\_\_\_.

*Example 6: Entirely indifferent between one glass of apple juice and one glass of orange juice*

Apple juice and orange juice are perfect substitutes.

⇒ \_\_\_\_\_ is a \_\_\_\_\_.

⇒ \_\_\_\_\_ have a \_\_\_\_\_.

⇒ \_\_\_\_\_ are \_\_\_\_\_.

○ **Utility Function of Perfect Substitutes**

where \_\_\_\_\_ and \_\_\_\_\_ are \_\_\_\_\_  
 that \_\_\_\_\_ the \_\_\_\_\_  
 of Good 1 and Good 2 to the consumer.

⇒ Put  $x_1$  on the horizontal axis and  $x_2$  on the vertical axis, then the \_\_\_\_\_  
 of a typical indifference curve is given by \_\_\_\_\_.

▪ Any \_\_\_\_\_ of  
 \_\_\_\_\_ will also represent the perfect-substitutes preferences.

➤ If the consumer is willing to substitute Good 1 for Good 2 at a rate of one-to-one  
 ⇒ \_\_\_\_\_

➤ If the consumer would require two units of Good 2 to compensate for giving up  
 one unit of Good 1

⇒ Good 1 is \_\_\_\_\_ to the  
 consumer as Good 2

⇒ \_\_\_\_\_

⇒ Put  $x_1$  on the horizontal axis and  $x_2$  on the vertical axis, then the \_\_\_\_\_  
 of the indifference curve is \_\_\_\_\_

- **Perfect Complements** – Goods that are always \_\_\_\_\_  
\_\_\_\_\_ in \_\_\_\_\_.

*Example 7: Left shoe and right shoe*

A left shoe will \_\_\_\_\_ unless  
\_\_\_\_\_ the \_\_\_\_\_.

- ① When there are \_\_\_\_\_ left shoes than right shoes, we will  
\_\_\_\_\_ right shoes to  
\_\_\_\_\_ left shoes.

⇒ \_\_\_\_\_ is \_\_\_\_\_.

- ② When there are \_\_\_\_\_ right shoes than left shoes, we will  
\_\_\_\_\_ right shoes to obtain an additional left shoe.

⇒ \_\_\_\_\_ is \_\_\_\_\_.

With ①②

⇒ \_\_\_\_\_ are \_\_\_\_\_.

⇒ \_\_\_\_\_.

○ **Utility Function of Perfect Complements**

where \_\_\_\_\_ and \_\_\_\_\_ are \_\_\_\_\_  
 that \_\_\_\_\_ the \_\_\_\_\_  
 in which Good 1 and Good 2 are consumed.

- Any monotonic transformation of  $u(x_1, x_2)$  will also represent the perfect-complements preferences.

- If the consumer wants to consume Good 1 and Good 2 in a proportion of one-to-one

⇒ \_\_\_\_\_

- If the consumer would require two units of Good 2 for each unit of Good 1

⇒ \_\_\_\_\_

⇒ By \_\_\_\_\_,

\_\_\_\_\_

- **Economic Bad** – Items of which \_\_\_\_\_ is \_\_\_\_\_ to \_\_\_\_\_, i.e., commodities that the consumer \_\_\_\_\_.

*Example 8: Class time*

Leisure time: economic good

Class time: economic bad

① At  $t_1$ : \_\_\_\_\_ time, \_\_\_\_\_ time has higher utility.

② At  $t_2$ : \_\_\_\_\_ time, \_\_\_\_\_ time has higher utility.

⇒ \_\_\_\_\_

- **Economic Neuter** – Items that the consumer \_\_\_\_\_  
\_\_\_\_\_.

*Example 9: Time with Dr. J*

Time with Dr. J does not contribute to anything, only leisure time contributes to a higher utility.

- **Quasilinear Preferences** – \_\_\_\_\_.
- **Utility Function of the Quasilinear Preferences**

where the utility function is \_\_\_\_\_ in Good 2, but  
 \_\_\_\_\_ in Good 1, e.g.,
