

**Intermediate Microeconomics (Fall 2023)**  
**Lecture 7**  
**Cost**

**Part I**

**Cost**

• **Cost Category**

○ **Accounting Cost** – \_\_\_\_\_.

○ **Economic Cost**

Economic Cost = \_\_\_\_\_

• **Components of Economic Cost**

○ **Total Cost (TC)** – \_\_\_\_\_

○ **Average Cost (AC) or Average Total Cost (ATC):**  $AC =$  \_\_\_\_\_

○ **Fixed Cost (FC)** – \_\_\_\_\_ of the \_\_\_\_\_ of  
 \_\_\_\_\_,  
 \_\_\_\_\_ the firm \_\_\_\_\_ output,  
 \_\_\_\_\_ in the \_\_\_\_\_.

○ **Quasi-Fixed Cost** – \_\_\_\_\_ of the \_\_\_\_\_ of  
 \_\_\_\_\_,  
 if the firm \_\_\_\_\_ a \_\_\_\_\_  
 of output, \_\_\_\_\_ in the \_\_\_\_\_.

➤ Just for information, and ignore it when calculating TC.

○ **Average Fixed Cost (AFC):**  $AFC =$  \_\_\_\_\_

○ **Variable Cost (VC)** – \_\_\_\_\_ on the \_\_\_\_\_  
 of \_\_\_\_\_: \_\_\_\_\_

○ **Average Variable Cost (AVC):**  $AVC =$  \_\_\_\_\_

○ **Marginal Cost (MC):**  $MC =$  \_\_\_\_\_ = \_\_\_\_\_ = \_\_\_\_\_

or  $MC =$  \_\_\_\_\_

⇒ In the \_\_\_\_\_, the \_\_\_\_\_ of \_\_\_\_\_  
 curve is \_\_\_\_\_

## ➤ In the Short-Run

- $TC =$  \_\_\_\_\_
- $AC =$  \_\_\_\_\_
- Many production processes have \_\_\_\_\_  
and \_\_\_\_\_

## ➤ In the Long-Run

\_\_\_\_\_  $\Rightarrow$  \_\_\_\_\_

- **Sunk Cost** – Expenditure that \_\_\_\_\_ and  
\_\_\_\_\_: another kind of \_\_\_\_\_.

⇒ It should always be \_\_\_\_\_ when \_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_.

E.g., pharmaceutical companies develop and test a \_\_\_\_\_  
– whether the drug is a \_\_\_\_\_ or a \_\_\_\_\_,  
these \_\_\_\_\_  
and thus are \_\_\_\_\_.

- **Cost Function**

- **Setting up**

- \_\_\_\_\_: Factor 1 with price \_\_\_\_\_
- \_\_\_\_\_: Factor 2 with price \_\_\_\_\_
- \_\_\_\_\_: production function
- Goal: figuring out the \_\_\_\_\_ way to produce a  
given level of output \_\_\_\_\_

- **Approach**

\_\_\_\_\_

\_\_\_\_\_

⇒ The solution to this problem provides the cost function of \_\_\_\_\_  
– A measure of the \_\_\_\_\_ of producing  
\_\_\_\_\_ units of output when factor prices are \_\_\_\_\_.

**Part II****Cost in the Short-Run**

- Relationship between MP and MC in the Short-Run**

Assume capital is fixed and labor is variable (W: \_\_\_\_\_)

⇒ MC = \_\_\_\_\_ = \_\_\_\_\_ = \_\_\_\_\_ = \_\_\_\_\_

⇒ MC = \_\_\_\_\_

⇒ \_\_\_\_\_ curve is the \_\_\_\_\_ of \_\_\_\_\_ curve

⇒ When the \_\_\_\_\_ of \_\_\_\_\_, the \_\_\_\_\_  
of \_\_\_\_\_, and vice versa

⇒ Because \_\_\_\_\_ of \_\_\_\_\_  
means \_\_\_\_\_  
is needed and thus, \_\_\_\_\_

○ \_\_\_\_\_  
⇒ \_\_\_\_\_ will \_\_\_\_\_

- **The Shape of Cost Curves in the Short-Run**

- At Point A: \_\_\_\_\_
  - Before Point A  
\_\_\_\_\_
  - After Point A  
\_\_\_\_\_
- At Point B: \_\_\_\_\_
- To generalize:
  - \_\_\_\_\_
  - \_\_\_\_\_
  - \_\_\_\_\_
  - \_\_\_\_\_
  - \_\_\_\_\_
  - \_\_\_\_\_
- \_\_\_\_\_ intersects \_\_\_\_\_ and \_\_\_\_\_  
at their respective \_\_\_\_\_.

*Exercise 1*

Cost function is given by  $C(Q) = 50 + 2Q + 4Q^2$ , calculate the minimum average cost.

*Exercise 2*

In the short-run, the average total cost to produce 100 cookies is \$0.25 per cookie, and the marginal cost is constant at \$0.10 for all cookies produced. Then the total cost to produce 50 cookies is

- A. \$12.5
- B. \$20
- C. \$25
- D. \$50
- E. Indeterminate.

*Exercise 3*

Refer to the figure.

When 5 units of output are produced, total cost starts to increase at a faster speed than the previous unit produced. Thus, when 2 units of output are produced

- A. marginal cost is falling.
- B. average total cost is falling.
- C. marginal cost is less than average total cost.
- D. All of the above.

*Exercise 4*

In the short-run, suppose average total cost is a straight line and marginal cost is positive and constant. Then, fixed costs must be

- A. declining with output.
- B. positive.
- C. zero.
- D. We do not have enough information to answer this question.

**Part III****Cost in the Long-Run**

- **Isocost Line** – \_\_\_\_\_ of \_\_\_\_\_  
and \_\_\_\_\_ that \_\_\_\_\_ the \_\_\_\_\_.  
It measures the \_\_\_\_\_ of the \_\_\_\_\_.

Isocost line: \_\_\_\_\_

where

\_\_\_\_\_ = \_\_\_\_\_ to \_\_\_\_\_

\_\_\_\_\_ = \_\_\_\_\_ on \_\_\_\_\_

= \_\_\_\_\_

Rearrange algebra,

\_\_\_\_\_

○ Vertical Intercept = \_\_\_\_\_

○ Horizontal Intercept = \_\_\_\_\_

○ Slope = \_\_\_\_\_

➤ **Map of Isocost Lines**

- **Optimal Production** – \_\_\_\_\_ at \_\_\_\_\_.

○ Point A:

➤ At Point A,

○

○

➤ **Conditional Factor Demand Function (also called the Derived Factor Demand) –**

A measure of the \_\_\_\_\_ between the \_\_\_\_\_ that \_\_\_\_\_ and the \_\_\_\_\_, \_\_\_\_\_ a \_\_\_\_\_ of \_\_\_\_\_, e.g., \_\_\_\_\_ and \_\_\_\_\_.

*Exercise 5*

Production function is given by  $Q = F(K, L) = K^{\frac{1}{2}}L^{\frac{1}{2}}$ ,  $w = \$10$ ,  $r = \$40$ , and the producer would like to spend \$2,000 on this product. Put labor on the horizontal axis and capital on the vertical axis, find the optimal production for this producer.

## Exercise 6

Refer to the figure.

When production moves from A to B, which of the following must be changed?

- A. The price of one of the inputs.
- B. The quantity to be produced.
- C. The budget of the producer.
- D. All of the above is possible.

**Part IV****Minimize Cost for Specific Technology**

- **Perfect Complements**

---

⇒ To produce \_\_\_\_ units of output, need \_\_\_\_ units of \_\_\_\_ and \_\_\_\_ units of \_\_\_\_

⇒ Minimal cost of production: \_\_\_\_\_

- **Perfect Substitutes**

---

⇒ Use \_\_\_\_\_ is \_\_\_\_\_

⇒ Minimal cost of production: \_\_\_\_\_

---

- **Cobb-Douglas**

## Part V

### Applications of Cost Function

- **Setting up**

- \_\_\_\_\_: fixed factor
- \_\_\_\_\_: the \_\_\_\_\_ of the fixed factor to produce a given level of output \_\_\_\_\_ – the firm's \_\_\_\_\_ for the fixed factor as a function of output
- \_\_\_\_\_: the \_\_\_\_\_ cost function of the firm given the fixed factor of \_\_\_\_\_
- \_\_\_\_\_: the \_\_\_\_\_ cost function of the firm – the \_\_\_\_\_ at the \_\_\_\_\_ of the \_\_\_\_\_  
 $\Rightarrow$  \_\_\_\_\_
- \_\_\_\_\_: a random level of output  $y$   
 $\Rightarrow$  \_\_\_\_\_: the \_\_\_\_\_ of the fixed factor for that level of output

- **The Shape of the AC Curve in the Long-Run**

- \_\_\_\_\_ for \_\_\_\_\_ of \_\_\_\_\_
- \_\_\_\_\_ at \_\_\_\_\_ of \_\_\_\_\_, the \_\_\_\_\_  
 $\Rightarrow$ 
  - \_\_\_\_\_ for \_\_\_\_\_ of \_\_\_\_\_
  - \_\_\_\_\_ at \_\_\_\_\_ of \_\_\_\_\_, the \_\_\_\_\_
- $\Rightarrow$  The \_\_\_\_\_ always \_\_\_\_\_ the \_\_\_\_\_ and they are \_\_\_\_\_ at \_\_\_\_\_
- $\Rightarrow$  The \_\_\_\_\_ is the \_\_\_\_\_ of \_\_\_\_\_

➤ The Figure of the AC Curve in the Long-Run

- **The Relationship between MC and VC**

\_\_\_\_\_

⇒ \_\_\_\_\_

⇒ The \_\_\_\_\_ the

\_\_\_\_\_ the  
is the \_\_\_\_\_ of producing \_\_\_\_\_ units of output

## Part VI

### Economies of Scale

- **Economies of Scale** – Situation in which \_\_\_\_\_ can be \_\_\_\_\_ for \_\_\_\_\_ a \_\_\_\_\_ of \_\_\_\_\_.
- **Diseconomies of Scale** – Situation in which a \_\_\_\_\_ of \_\_\_\_\_ a \_\_\_\_\_ of \_\_\_\_\_.

### ➤ Returns to Scale vs. Economies of Scale

- \_\_\_\_\_ returns to scale  
⇒ \_\_\_\_\_ AC, i.e., \_\_\_\_\_ of scale
- \_\_\_\_\_ returns to scale  
⇒ \_\_\_\_\_ AC, i.e., \_\_\_\_\_ of scale
- \_\_\_\_\_ returns to scale  
⇒ \_\_\_\_\_ AC

➤ **Reasons for Economies of Scale**

- ① \_\_\_\_\_ allows  
\_\_\_\_\_ to \_\_\_\_\_.
- ② \_\_\_\_\_ can provide \_\_\_\_\_  
by \_\_\_\_\_ the \_\_\_\_\_  
of \_\_\_\_\_, so that \_\_\_\_\_  
can \_\_\_\_\_.
- ③ Firms can \_\_\_\_\_ at \_\_\_\_\_  
because buying them in \_\_\_\_\_ and  
therefore \_\_\_\_\_.

➤ **Reasons for Diseconomies of Scale**

- ① \_\_\_\_\_ factory \_\_\_\_\_ and  
\_\_\_\_\_.
- ② \_\_\_\_\_ a \_\_\_\_\_ firm becomes  
\_\_\_\_\_ and \_\_\_\_\_  
as the number of \_\_\_\_\_.
- ③ The \_\_\_\_\_ of \_\_\_\_\_ will  
\_\_\_\_\_ at some point because of \_\_\_\_\_.

## Part VII

## Economies of Scope

- **Economies of Scope** – Situation in which \_\_\_\_\_ of a \_\_\_\_\_ is \_\_\_\_\_ than the \_\_\_\_\_ that could be achieved by \_\_\_\_\_ when \_\_\_\_\_ produces a \_\_\_\_\_. In this case, it is \_\_\_\_\_ to produce \_\_\_\_\_ than \_\_\_\_\_.

This is because

- ① \_\_\_\_\_  
 ⇒ \_\_\_\_\_  
 ② \_\_\_\_\_ of \_\_\_\_\_

*Example 1*

- ① An orange juice factory produces with orange \_\_\_\_\_ but do not need orange \_\_\_\_\_, so they discard all the orange \_\_\_\_\_.
- ② A pharmaceutical factory needs to extract an ingredient from orange \_\_\_\_\_ but do not need orange \_\_\_\_\_, so they discard all the orange \_\_\_\_\_.
- If the two factories were built \_\_\_\_\_, they could \_\_\_\_\_ their \_\_\_\_\_ by \_\_\_\_\_ the oranges, as oranges are \_\_\_\_\_ the \_\_\_\_\_ and \_\_\_\_\_ is \_\_\_\_\_.

- **Diseconomies of Scope** – Situation in which \_\_\_\_\_ of a \_\_\_\_\_ is \_\_\_\_\_ than could be achieved by \_\_\_\_\_ when \_\_\_\_\_ produces a \_\_\_\_\_.

- **Cost Complementarities** – Situation in which \_\_\_\_\_ of producing \_\_\_\_\_ as \_\_\_\_\_ of \_\_\_\_\_ is produced.

\_\_\_\_\_

### Exercise 7

Bubba Burgers has discovered there are economies of scope available to the restaurant. Which is most likely to be a response to this discovery?

- A. Bubba adds more varied inputs to burger production.
- B. Bubba expands burger production, focusing on that one good.
- C. Bubba contracts burger production.
- D. Bubba adds grilled chicken sandwiches to the menu.
- E. Bubba cuts back on the diversity of the menu.
